In just a few months CloudWerx was able to support the planning of GCP growth through fully customized GCP migration.

Hybrid EDA Transformation with Novumind

TLDR

System deployment time decreased from months to ~30 minutes while significantly improving user experience and enhancing information security for the client. CloudWerx provided a detailed Optimization Report, giving NovuMind a snapshot of their baseline, and then a "Project Recap," highlighting how CloudWerx improved performance, reduced staff workload, optimized the environment, secured the environment, and other notable impacts.

About

NovuMind helps companies leverage the power of AI in their products and services. Their NovuTensor chip is an industry breakthrough – designed to enhance business functions by "making things think." They offer a wide range of deep learning tools to help apply NovuTensor in a multitude of operations, allowing businesses to optimize for AI computation.

Customer Challenge

Novumind had no prior GCP experience and was working under extreme time constraints (July- August) to complete the PoC before their EDA tools license expiration. They are ramping up, requiring them to expand their environment very quickly but working with a globally dispersed team and only a single Systems Engineer for their entire infrastructure.

Solution

CloudWerx delivered a custom solution to create, deploy, and [eventually] destroy a 'CloudPC' experience for the globallydispersed engineers. This solution increased security, lowered infrastructure costs, and improved the user onboarding experience. Within the CloudPC, Cloudwerx created a mechanism to allow users to install software packages without compromising security or system stability.

The Outcome

Cloudwerx created a Custom 'Cloud PC' Experience for NovuMind Engineers and Administrators.

Features of Engineer Experience:

- Each engineer is assigned a Cloud PC with persistent storage
- Through this, they can access NovuMind assets, IP and Synopsys
 tooling
- Access is available via Nomachine client or web browser

Features of Admin Experience:

- Easily able to create new Cloud PCs
- Ability to use commands to update all Cloud PCs at once
- Simple scripts to destroy old Cloud PCs to free up resources and archive data
